

Volcanic Ash Modeling for North Pacific Volcanoes Automated Operational Monitoring and Virtual Globes

Peter Webley

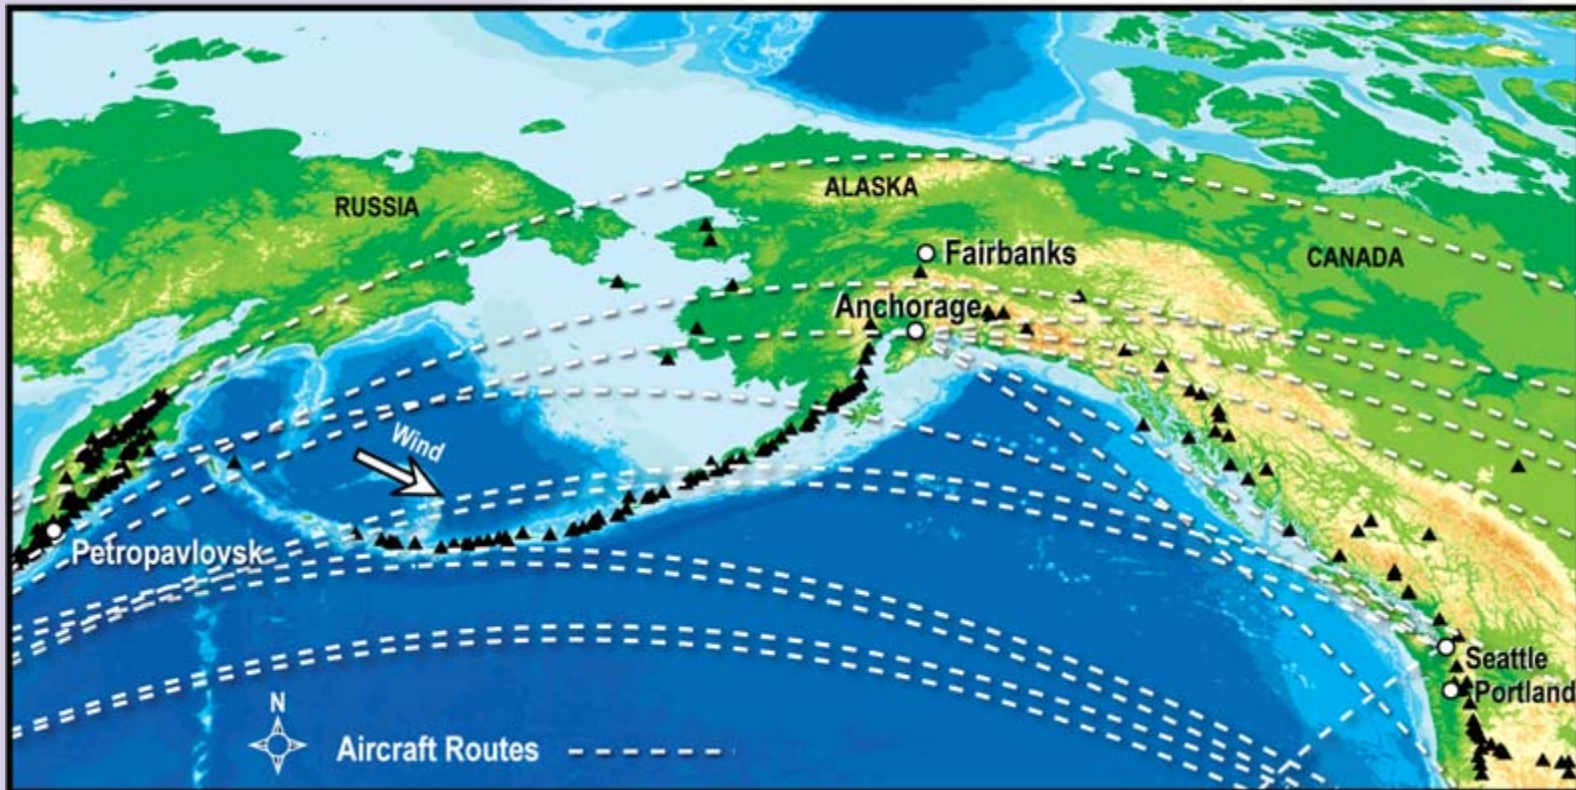

Arctic Region Super Computing Center (ARSC)
Alaska Volcano Observatory (AVO)
Geophysical Institute (GI)
University of Alaska Fairbanks (UAF)

K. Dean, J.E. Bailey and J. Dehn

NOPAC volcanoes

- ~100 active volcanoes in North Pacific (NOPAC)
- 1975 – 2006, >100 separate volcanic ash clouds > 20 kft
- +8000 flights per year of NOPAC flight routes
- In 1999, \$12 million cargo over the region

AVO :: Alaska Volcano Observatory

- Three groups
 - University of Alaska Geophysical Institute (UAF-GI)
 - United States Geological Survey (USGS)
 - Alaska Division of Geological and Geophysical Surveys (ADGGS)
- Responsible for volcano monitoring in NOPAC region
- Liaising with Agencies such as NWS and VAAC
- Seismology, Remote Sensing, Geodesy and Geology

Remote Sensing at AVO-UAF

What is the Puff model?

- Specifically tailored for 3D tracking of volcanic ash particles
- Ash particles released over volcano and tracked over time
- Uses meteorological wind fields
- Initialization parameters include
 - Volcano name and location
 - Number of particles
 - Mean Particle size and spread
 - Plume dimensions (height, width and shape)
 - Length of model prediction and length of eruption
 - Output time step
 - Horizontal and Vertical Diffusion
 - Wind field model

Puff System pre 2006

- Run Puff when an event occurs
- What do we use as initial conditions?
 - Wind field [Regional or Global]
 - Plume height [8, 10 or 16 km]
 - Duration [1, 3 or 24 hrs]
 - Start time [Now, 3 hrs past, yesterday]
- Can we get someone to run the model at 3am?
- Region of interest for ash movement?
- How long to run for? ---- 6, 12, 24 hrs
- When do we do the next update? ---- 1, 3, 6 hrs

The 5 minute warning

- In USA, NWS and FAA work together
- In Alaska, the AAWU and Air traffic controllers in same room
- When an eruption has been confirmed, they want to know where the ash is ASAP
- AAWU would run Puff or Hysplit or contact AVO

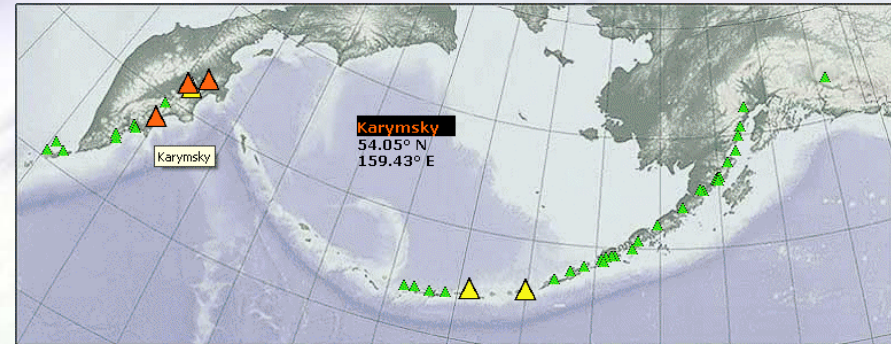

National Weather Service

Alaska Aviation Weather Unit

Automated Monitoring

- 12 volcanoes in NOPAC
 - Alaska : Augustine, Cleveland, Korovin, Veniaminof, Pavlof and FourPeaked
 - Kamchatka : Bezymianny, Chickurachki, Karymsky, Kliuchevskoi and Shiveluch
 - Cascades : St Helens
- 4 in Indonesia Region
 - Anatahan, Kelut, Semeru and Manam
- 3 in Ecuador
 - Reventador, Sangay and Tungurahua
- 1 in Caribbean
 - Soufriere Hills
- 2 in Italy
 - Etna and Stromboli
- 2 in Mexico
 - Popocatepetl and Colima
- NOPAC volcanoes updated Puff model forecast every 3 hrs
- Worldwide volcanoes updated Puff model forecast every 6 hrs
- Plume heights range from 4 – 16 km (up to 20 km for SHV)
- NWP wind fields
 - NAM 216 fields for NOPAC (45 km resolution)
 - AVN for Worldwide (~100 km resolution)

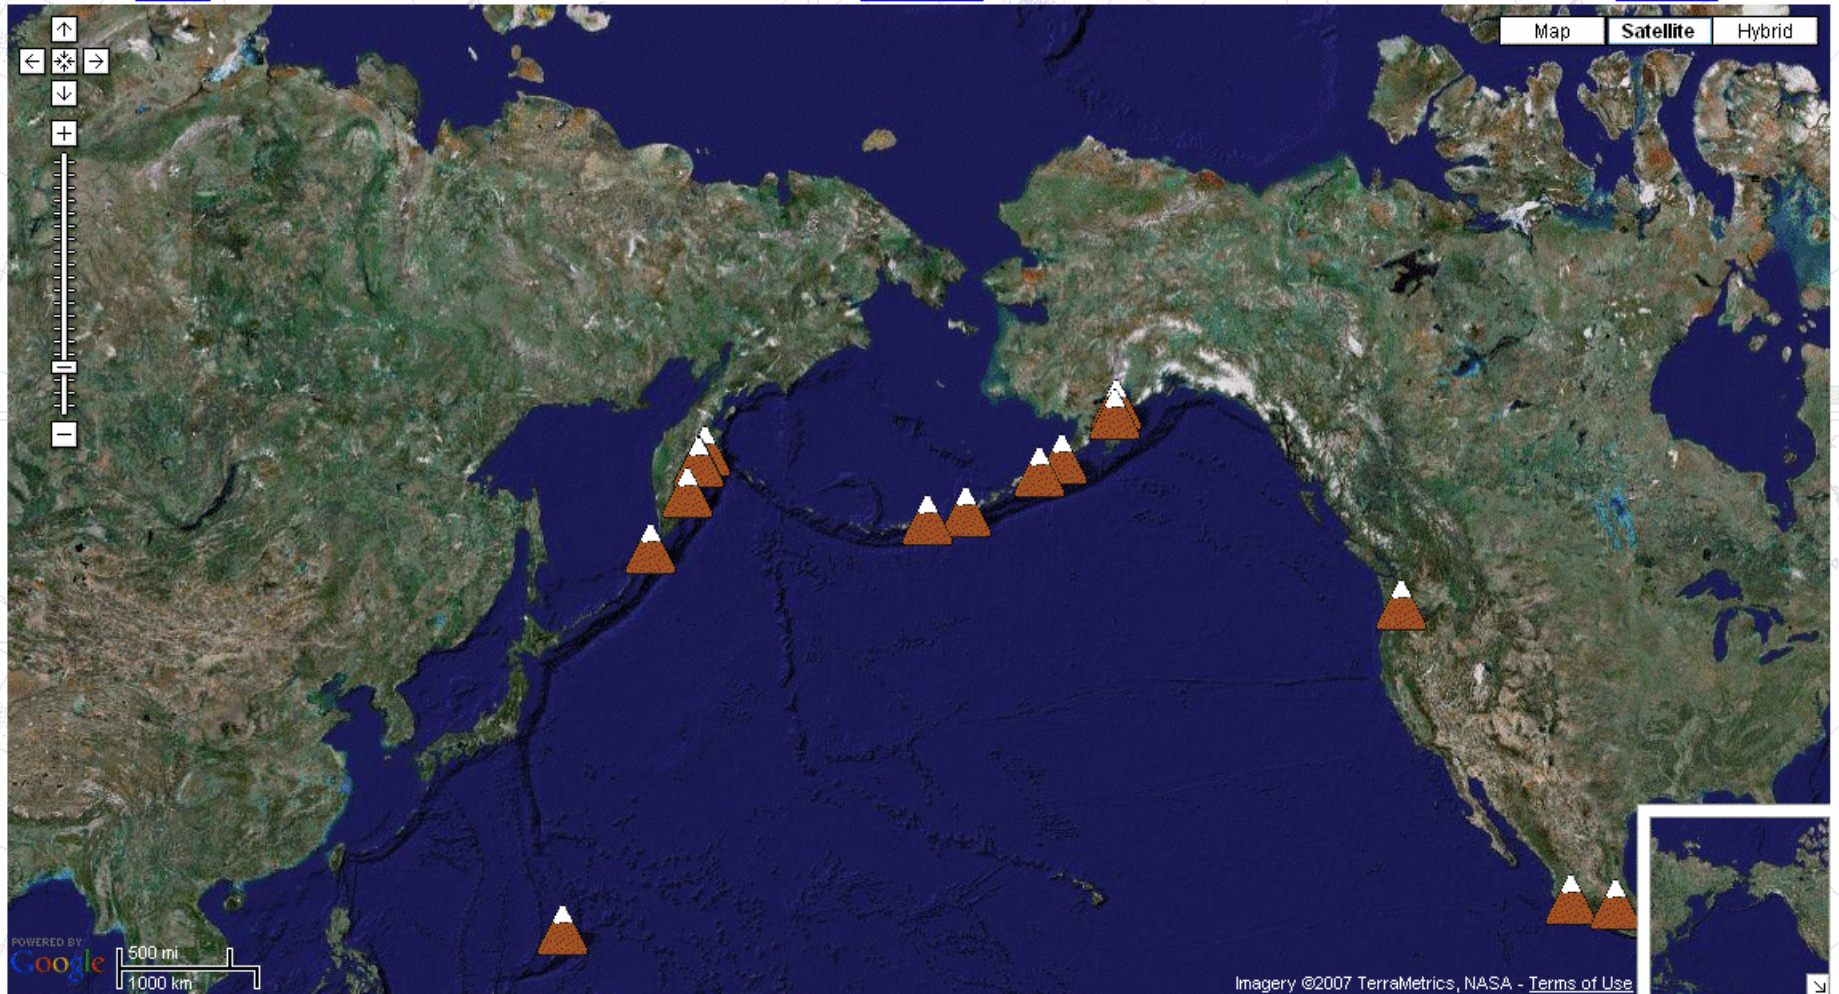

Volcanoes : Alaska and Kamchatka
at elevated alert (June 2007)

No need for personnel
to be running the
model 24 hrs a day

KVERT June 30, 2007 for Kliuchevksoi

Kamchatkan and Northern Kuriles Volcanic Activity
KVERT INFORMATION RELEASE 30-07
Saturday, June 30, 2007, 01:15 UTC (14:15 KDT)

KLYUCHEVSKOY VOLCANO; 56°03'N, 160°39'E; Elevation 4,750 m
CURRENT LEVEL OF CONCERN COLOR CODE IS RED

The strong explosive-effusive eruption of the volcano continues. Ash explosions more than 10 km (32,000 ft.) ASL could occur at any time and could affect international and low-flying aircraft.

Seismic activity of Kluchevskoy was at the medium level (less than $4\text{-}7 \times 10^{-6}$ mps) at 00:00 UTC on June 29 and remains at this level to present time, 01:00 UTC on June 30. According to visual and video data, continuous ash emission to more than 10 km (or 32,000 ft) and extended to the west began to be observed from 21:05 UTC on June 29 till present time. According to satellite data, ash plumes extended for 300 km (187 mi) to the east from Klyuchevskoy volcano.

Approximate plume altitude: 9000 m (29,500 ft) ASL (by atmospheric soundings). Based on past eruptions, this could continue for some hours or days. View from MTSAT the plume is moving to east and west for last 6 hours. All local aviation authorities have urgent information from KVERT.

According to the puff prediction for potential eruption the plume for about 10 km (or 32000 ft) will move to south-west from volcano. According to

Strong terminal paroxysmal eruptions of the volcano occurred in 1945 (lasting for 1 month), 1984-1985 (18 months), 1987 (2), 1990 (7), 1994 (< 1), 1998 (6) and 2005 (3). Ash plumes during these eruptions rose up to 7.0-8.0 km (23,000-26,200 ft) ASL but were briefly as high as 10.0-13.0 km (33,000-42,600 ft) ASL.

IF YOU HAVE ANY QUESTIONS OR CONCERNS, PLEASE CONTACT:

The Kamchatkan Volcanic Eruption Response Team (KVERT) is a non-commercial cooperative program of the Alaska Volcano Observatory (AVO, USA), the Institute of Volcanology and Seismology (IVS) FED RAS and the Kamchatkan Branch of Geophysical Survey (KB GS) RAS (Russia).

KVERT staff is available in the office from 8:30 AM till 6:00 PM (KST or KDT) and by phone during the evenings. KVERT uses daily satellite imagery, information from remote scientific observation stations, real-time seismic data for 10 volcanoes, and other information to monitor activity at Kamchatkan and Northern Kuriles Volcanoes.

From Alaska Interagency Plan

2.5.3 ASH TRAJECTORY FORECASTS FROM NUMERICAL MODELS

The AAWU should initiate the **PUFF** trajectory model available on the local area network at the VAAC when a volcanic eruption is suspected or has occurred. The PUFF is intended to provide guidance to forecasters for preparing the initial ash SIGMET and VAA. It is also useful for minor ash producing eruptions with the potential to affect airports within 40 nautical miles of the volcano.

IAVWOPSG/3-WP/9
Appendix

A-30

VAAC WELLINGTON

Executive Summary

The only substantive activity occurring during the period covered by this report were the eruptions of the **Lopevi** volcano in Vanuatu during January and May 2006 and the **Raoul Island** volcano northeast of New Zealand in March 2006. There was volcanic activity less significant to aviation at **Aoba** volcano in Vanuatu and at **Home Reef** undersea volcano in Tonga. Volcanic Ash Advisories (VAA) were issued by the Wellington VAAC for the significant activity. VA SIGMET were issued by the Wellington Meteorological Watch Office in response to the Raoul Island VAA issued.

There have been no significant changes in the operational status, methods or area of responsibility of the Wellington VAAC. The VAAC continues to use the CANERM, HYSPLIT, and **PUFF** models for trajectory forecast information.

The Wellington VAAC has remained operational for the period with no outages resulting from internal or external issues. Periodic testing of VAAC procedures were undertaken and the results used to further develop the procedures.

A website for the Wellington VAAC has been completed containing the IAVW descriptive information, current VAA and links to other VAACs.

MTSAT imagery remains under evaluation for use by the VAAC.

From IAVW

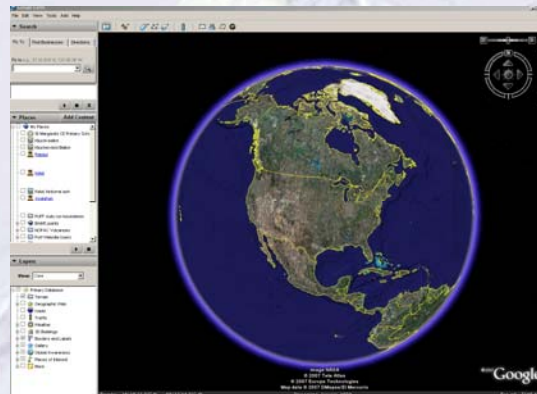

Wellington VAAC

Virtual Globes

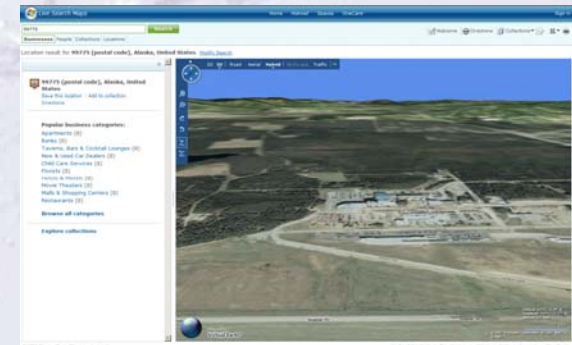

- They have become widely used for visualization in the scientific environment.
- They have become a tool for displaying three dimensional geophysical data both operationally and retrospectively.
- In the recent past, Puff forecasts have been displayed as two dimensional maps of ash location, color-coded by altitude and/or relative ash concentration.
- This is a useful tool for operational analysis but does not take full advantage of the three dimensional nature of the data.
- Google Earth is one of the many “Virtual Globes” available.
- Use the Google Maps API to centralize all the Puff model runs for the NOPAC and how Google Earth can be used to display VATD simulations in both two and three dimensions.

Redoubt-KLM ash encounter

- Dec 1989, Mount Redoubt volcano produced numerous volcanic eruptions.
- The flight 867 entered the ash cloud at approximately 25,000 ft 150 miles NNE of Mount Redoubt.
- Immediately the aircrew increased power and attempted to climb out of the ash cloud.
- The aircraft descended approximately 13,000 ft to within a few thousand feet of the ground before the crew restarted the 4 engines.
- Performed an emergency landing at the nearby Anchorage airport.
- Even though there were no injuries to passengers, the damage to engines, avionics, and aircraft structure from this encounter was significant.

Timing	Event
11:40 AST	Airplane begins descent from 35,000 ft
11:46 AST	Airplane encounters ash cloud at 25,000 ft
11:47 AST	Airplane loses power on all four engines after climbing to 27,000 ft
11:52 AST	Airplane engines 1 and 2 restart at 17,000 ft
11:55 AST	Airplane engines 3 and 4 restart at 13,000 ft
12:25 AST	Airplane lands at Anchorage International Airport.
